# Extend shipping to your business systems

with ShipExec® technology for Oracle® ERP

The UPS® Customer Solutions Advanced Shipping Technologies team is comprised of experienced developers and integrators who develop, implement, and integrate advanced shipping systems.

ShipExec technology provides a foundation for connectivity between your systems and carrier-specific functionality. The end result is a tailored and integrated shipping solution.

We know that every business is a little different, so when it comes to configuration, our professionals can match your business rules, the carriers you use, and service delivery commitments with one global solution.

Integration for Oracle enterprise resource planning (ERP) software

Customer Solutions has the experience and expertise to embed premier shipping capabilities using ShipExec™ software. Working with Oracle, you can enable native shipping directly from within the Oracle E-Business Suite.

Our experts can help integrate key capabilities, such as shipment tracking, accessorials processing, and automatically combining same destination shipments into your business planning software. With ShipExec technology, your ERP platform can help determine the best mode and service options for shipping, as well as make packing and weighing part of the same process for your staff.

Working together, ShipExec functionality and your ERP can reduce times to final delivery and expensive address correction charges using address verification. Adding ShipExec software will allow you to pre-fill customer requirements and automate customs filing to help reduce errors and improve your customers experience.

Functionality made personal

ShipExec™ technology provides all the features you demand in your shipping applications:

- Integrating shipping functionality at any point in the order pipeline
- Interfacing your shipping directly into management, order entry, and customer service systems
- Managing carrier-compliant labels and shipment documentation requirements for multiple carriers

Features that support your business

Using ShipExec multi-carrier capability can support more than 150 different carriers. With that many carriers, we've made sure to include a way to create and manage shipments, including small parcel and freight.

ShipExec functionality also gives you global access, which means that you can originate your shipments internationally and to over 100 countries worldwide.

Options for mode and packaging optimization give you choices; not only in box sizes, but also in the carrier and services selected.

Precision processing takes the guesswork out of how to make shipping decisions. We enable your forward-thinking business logic to be embedded in the work-flow at any point during the process.

Deployment options

Several ShipExec deployment options are available to best suit your needs.

- Traditional – Our experts install the hardware and software you need on-site, behind your security firewalls
- Cloud – UPS handles the tenancy, configuration, maintenance, and updates remotely in our secured data center
- Web Service – common API platform used to exchange information

We can also create a hybrid deployment solution that works for you.

Get started using ShipExec™ technology

Your UPS Account Executive can assist you in learning more about this solution and connecting you with UPS's Customer Solutions team. Working together, UPS and you will determine which solutions will work best for your business to help you meet your supply chain goals.
